

LinkedIn API People Profile Cheat Sheet

When to use the official LinkedIn API

Use LinkedIn's official API when you need authenticated member actions, Sign In with LinkedIn, or you are already an approved partner. Expect OAuth flows, restricted access, and limited profile data for most developers.

When to use NinjaPear's Person Profile Endpoint

Use NinjaPear when your goal is person enrichment rather than LinkedIn platform integration. You can search by work email, name plus company, or role plus company and get structured person data from public web sources without scraping LinkedIn.

Practical build choices

If you need posting, invitations, or other native LinkedIn actions, use LinkedIn. If you need profile-shaped enrichment data, verified work emails, or adjacent enrichment like similar people and company data, use NinjaPear.
